

BAHRAIN POLYTECHNIC
MSc Artificial Intelligence | IT9099 Thesis
Similarity Self-Check Report

Hatem Isa | Student ID 202508993

Documents assessed: 202508993_Thesis.pdf and 202508993_Paper_ECIR2027_LNCS.pdf

IMPORTANT. This is a locally computed self-check, not a Turnitin report. It was produced by direct text comparison against the sources listed in Section 3.2, which include the institutional templates, the programme handbook, and the full text of all 49 research papers cited in the thesis. No internet search and no student paper repository were consulted. Section 7 states what this method cannot see.

1 Summary of Findings

Measured against the sources available for comparison, similarity in both submitted documents falls far below the 15 percent threshold. The thesis body records 15 matched sequences across 13,339 eight word sequences, which is 0.11 percent.

Document	Words assessed	Matched text	Similarity	Threshold	Result
Final Thesis (Chapters 1 to 7)	13,430	15 of 13,339 8-grams	0.11%	15%	PASS
Conference Paper (ECIR 2027 format)	4,778	491 of 4,746 8-grams	10.35%	15%	PASS

Every one of the 15 matches recorded against the thesis is either a section heading prescribed by the institutional template or the formal name of a Bahraini statute. Section 5 lists all of them individually. Excluding those two categories, matched text in the thesis is zero.

The 491 matches recorded against the conference paper are overlaps with the author's own thesis, which reports the same underlying study. Measured against every external source in the comparison corpus, the paper records 3 matched sequences, which is 0.06 percent. Section 6 separates the two figures.

2 Requirement Being Evidenced

The IT9099 Final Thesis Submission page states that a plagiarism report must be submitted, that 15 percent similarity or less is acceptable, and that the reference list, direct quotations, and the standard front matter may be excluded from the calculation.

Those exclusions have been applied to the scope of this report. Section 3 records exactly what was assessed and what was excluded.

3 Scope and Method

3.1 Regions assessed

Region	Words	Status
Thesis Chapters 1 to 7	13,430	ASSESSED
Thesis front matter, References, Appendices	2,933	Excluded per submission rules
Conference paper, Abstract to Conclusion	4,778	ASSESSED
Conference paper reference list	n/a	Excluded per submission rules

3.2 Comparison corpus

The assessed text was compared against every institutional and project document available locally, and against the full text of every research paper the thesis cites:

- Template C, Final Project Report, the prescribed thesis structure
- Template D, Demonstration and Viva Pack
- Template A, Thesis Proposal, and Template B, Mid Review Brief
- MSc AI Thesis Handbook 2026, and the prior course thesis exemplar
- The full text of all 49 research papers cited in the thesis, comprising 571,778 distinct eight word sequences
- The author's own Final Thesis, used as the comparison source for the conference paper
- The author's own Thesis Proposal and Mid Review submissions, reported separately in Section 6.2

3.3 Matching method

Text from each document was lowercased, stripped of punctuation, and decomposed into overlapping sequences of eight consecutive words. A sequence occurring in both the assessed text and a comparison source is counted as matched. Similarity is the proportion of the assessed document's sequences that are matched.

Eight words is a deliberately strict window. Sequences that short occur by chance only rarely in technical prose, so the method is sensitive to verbatim reuse. It reports every match it finds, including reuse the submission rules permit, which is why Section 5 itemises each one rather than reporting a single total.

4 Thesis Results by Chapter

Chapter	Words	8-grams	Matched	Similarity
Chapter 1 Introduction	949	942	1	0.11%
Chapter 2 Literature Review	3,966	3,959	0	0.00%
Chapter 3 Methodology	1,993	1,986	7	0.35%
Chapter 4 Implementation	1,893	1,886	0	0.00%
Chapter 5 Results and Evaluation	1,927	1,915	2	0.10%
Chapter 6 Discussion	1,826	1,818	1	0.06%
Chapter 7 Conclusion and Future Work	876	869	4	0.46%
OVERALL	13,430	13,339	15	0.11%

Chapter 2, the Literature Review, records zero matched sequences across 3,959 8-grams. Every source in that chapter is paraphrased and attributed, and none is reproduced verbatim. Chapter 4, the Implementation chapter, likewise records zero.

5 Itemised Matches, Thesis

All 15 matched sequences are listed below with their origin. Thirteen are section heading sequences carried over from the prescribed Template C structure. Two are the formal name of the Bahrain Personal Data Protection Law, which cannot be paraphrased without misnaming the statute.

#	Matched sequence	Origin	Category
1	3 3 datasets 3 3 1 sources and	Template C	Prescribed heading
2	3 4 models and algorithms 3 4 1	Template C	Prescribed heading
3	3 6 evaluation methodology 3 6 1 metrics	Template C	Prescribed heading

4	3 datasets 3 3 1 sources and licensing	Template C	Prescribed heading
5	4 models and algorithms 3 4 1 baseline	Template C	Prescribed heading
6	5 results and evaluation 5 1 experimental setup	Template C	Prescribed heading
7	7 conclusion and future work 7 1 summary	Template C	Prescribed heading
8	and future work 7 1 summary of contributions	Template C	Prescribed heading
9	chapter 1 introduction 1 1 background and context	Template C	Prescribed heading
10	chapter 5 results and evaluation 5 1 experimental	Template C	Prescribed heading
11	chapter 6 discussion 6 1 interpretation of findings	Template C	Prescribed heading
12	chapter 7 conclusion and future work 7 1	Template C	Prescribed heading
13	conclusion and future work 7 1 summary of	Template C	Prescribed heading
14	data protection law law no 30 of 2018	Thesis Handbook	Statute name
15	personal data protection law law no 30 of	Thesis Handbook	Statute name

Excluding prescribed headings and the statute name, matched text in the thesis is zero.

6 Conference Paper Results

6.1 Overlap with the author's own thesis

Comparison source	Matched 8-grams	Similarity
Author's own Final Thesis, Chapters 1 to 7	491	10.35%
Institutional templates and handbook	2	0.04%
All 49 cited research papers	3	0.06%
EXTERNAL COMBINED	3	0.06%

The conference paper and the thesis report the same underlying study, so overlap between them is expected and is not concealed. Set against every external source in the comparison corpus, the paper records 3 matched sequences, which is 0.06 percent.

6.2 Self-match disclosure

The thesis body shares 82 eight word sequences, which is 0.61 percent, with the author's own Thesis Proposal and Mid Review submissions made earlier in this programme. This is declared here because a similarity service holding a repository of prior student submissions will detect it. It is the author's own previously submitted work within the same programme, and the thesis develops directly from it.

7 Limitations of This Report

These limitations are stated so that the report is not read as more than it is.

- No internet search was performed. Similarity against web sources, preprints, and published articles is not measured here and is measurable only by a service with a web index.
- No student paper repository was searched. Similarity against other students' submissions cannot be assessed by this method.
- The method detects verbatim sequences of eight or more words. It does not detect paraphrase, translated material, or structural imitation.
- Quoted material is not separately segmented, because the assessed text contains no block quotations. All 49 sources in the thesis are paraphrased and attributed in IEEE numeric style.

For those reasons the institutional Turnitin report remains required, and this document is intended to be submitted alongside it.

8 Declaration

The work assessed in this report is my own. Every source consulted is attributed in IEEE numeric style, and no text has been reproduced from another author without attribution. Where sequences matched the institutional template or the name of a statute, those matches are itemised in Section 5 rather than excluded silently.

Signed: Hatem Isa

Date: 24 August 2026

Method note. Figures in this report were computed by direct 8-gram comparison of the submitted documents against the comparison corpus described in Section 3.2. The comparison is reproducible: the same procedure applied to the same documents returns the same figures.
